Abhinav Srivastava

San Francisco Bay Area | abhinavmirdev@gmail.com | abhinavmir.xyz | github.com/abhinavmir

Skills

Languages: Python, SQL, TypeScript.
Frontend & Mobile: React, Next.js, React Native, Expo, Flutter, TanStack, Native iOS, Express, Django, Flask, FastAPI.
Cloud & DevOps: AWS, GCP, Docker, Kubernetes, Terraform, GitHub Actions, Redis, RabbitMQ, Grafana.
Security & Leadership: SOC 2, Enterprise IT, Requirements Discovery, Customer Onboarding, Engineering Mentorship.

Experience

Founding Engineer, Ambra – San Francisco, CA May 2025 – Present

- Built agentic AI workflows in Python for denial-appeal automation, standardizing reusable components across customer deployments. Recovered approximately $20K per customer and saved 40 hours per biller per month.
- Delivered claim-status and denial-appeal features through Agile development practices, leading sprint-planning sessions, coordinating iterative delivery, and mentoring 3 engineers through reviews and software design feedback.
- Built evolving AI voice agents to call insurance companies for updates on claim status or info for denial and request EOBs.
- Designed and deployed containerized Python microservices using Docker and Kubernetes, with Redis caching and RabbitMQ message queues for asynchronous processing. Deployed on Google Cloud.
- Leading the SOC 2 Type I and II compliance project complete with documentation, infrastructure, and communications.
- Built CI/CD pipelines with GitHub Actions to automate testing and deployment; implemented Grafana monitoring and alerting to support production troubleshooting. Metabase for internal KPI and analytics.
- Developed a multi-platform AI Scribe for EMTs and paramedics with offline recording and EMS reporting integrations, increasing annual contract value per customer by 60%, deployed at 4 clinics handling ∼10,000 transports a year.

Software Engineer II, Commure – Mountain View, CA June 2024 – May 2025

- Developed 15+ Python-based EHR integrations for clinical documentation, designing reusable integration components and APIs with retries and error handling. Lead operator friendly no-touch development, and configurable setups.
- Collaborated with product, QA, vendors, & customers to translate requirements to technical designs and deliverables.
- Identified and mitigated 4 potential security leaks, coordinating disclosure and remediation with auditing vendors.
- Led development of a wearable necklace for AI-powered clinical documentation, with the project presented to the country's largest hospital chain, with positive feedback.
- Migrated the Scribe web from Flutter to React, enabling component reuse across products for self-serve markets.

Software Engineer, Ignite Tournaments – Remote, US Sep 2021 – Sep 2022

- Built React and Next.js interfaces for tournament and player workflows, integrating backend APIs and Web3 wallets.
- Developed and launched Solidity smart contracts supporting tournament entry fees, prize pools, payouts, and tokens.
- Migrated smart-contract development and testing to Hardhat and built CI/CD pipelines to automate builds, and testing.

Projects

A Tiered Access-Control Framework for Securing LLM Voice Agents on FHIR HealthSec '26

- Developed a realistic attack vector model for malicious actors attacking FHIR-connected LLM voice agents based on observations at how clinical voice agent companies developed the agents.
- Proposed a framework that uses tiered access control for better damage control against malicious actors.
- Addressed reviewer concerns and will be presenting the paper at HealthSec '26.

Soquel: A finder replacement for MacBook trysoquel.com

- Built an open-source macOS file manager featuring tree-based multi-pane navigation, local semantic search, AI-powered file organization, and support for cloud drives and SFTP.

Earmarky: A native macOS audiobook player for Audible earmarky.com

- Built a Swift app for MacOS that signs in through Amazon and allows user to use Audible on Mac Natively.

harnext: Move coding-agent chats between harnesses npm: @buildingthefuture/harnext

- Built a TypeScript CLI that transfers, syncs, searches, and resumes agent chats across Claude Code, pi, Oh My Pi, and Codex, and exports prompt history as HTML, Markdown, or text.

Open Source Contributions

Languages & Tooling: Go, Cython, Ruff, jq, Zed, fish, Sail, uutils/coreutils, uutils/findutils
Databases & Infra: DuckDB, redis-rs, StackExchange.Redis, Kombu, Reth, Apache NuttX, Zephyr, Flatpak

Education

Boston University – MS in Computer Science, spl. CyberSecurity 2022 – 2024
Vellore Institute of Technology, India – BS in Computer Science 2017 – 2021
